IncreMedical Enhances its Population Health Solutions

IncreMedical's IT division Medadept announces the development of new technology to support care management and patient engagement

St John Indiana - IncreMedical announced today that its information technology division, Medadept LLC, has developed a comprehensive care management IT and analytics platform to support its population health management advisory service offerings. The care management platform is comprised of 2 integrated components: Synchrony Coordinator™ a "provider facing" care coordination software and WatchWell™ a "patient facing" mobile patient engagement application.

Tom Squires, Medadept's lead designer of the care management software platform said, "The care management platform was designed to support IncreMedical's cross-continuum care management advisory solutions for chronic disease and post-surgical patient populations by reducing fragmented and poorly coordinated care. The platform enables communication between care team members and patients, facilitates effective transitions of care and care plan coordination between care settings, while supporting patient engagement and patient self-care at home."

According to Gerry Bedwell, Medadept's Sr. VP of information Technology, "By promoting collaborative and engaged care and monitoring a patient's health status along the continuum, our care management IT platform assists patients, care coordinators, case management teams, physicians and other care team members to effectively and efficiently improve patient outcomes and satisfaction while reducing unnecessary costs related to avoidable hospitalizations or preventable health condition complications."

Greg Cooper, a Managing Partner at IncreMedical stated, "As our hospital, ACO and post-acute care clients increasingly participate in population health management initiatives and other alternative value based contract arrangements, there has been an expansion of focus on preventing unplanned hospitalizations beyond 30 days. Providing IT-enabled solutions to efficiently manage a patient's health as they transition from acute care to post-acute care and home settings has become critical to achieving successful clinical and financial outcomes."
